

LEPIDOCROCITE

(see also goethite, limonite)

Occurrences and associations are like those of goethite (q.v.). Lepidocrocite is a constituent of limonite but usually requires X-ray diffraction analysis for verification. Probably much more widespread than the record shows. Chiefly Northern Peninsula.

Dickinson County: Menominee iron range: More abundant in its western part. Found in limonitic ores associated with goethite (Brower, 1968).
